

# System Customization

## Limitless options.

Should customer requirements evolve outside of standard system capabilities, our Custom Engineering Services Division may be contracted to extend the existing Aegis system functionality or to tie FactoryLogix to other customer business systems.

Aegis offers a comprehensive MES solution that satisfies the majority of our customer's requirements with highly configurable "out-of-the-box" functionality.

Even production, machine and business system integration is often accomplished by Aegis' numerous standard, defined interfaces.

In the event that specific customer requirements cannot be met by our standard system, we offer system customization services to fill the gaps.

### Common customization projects:

- Data acquisition from proprietary test equipment or a unique production machine
- Data exchange with other business systems

- Migration tool to port historical data from existing MES system
- Industry-specific function or data collection requirement
- Aegis utilizes a simple but effective process to ensure that our customer's goals through customization are realized in a timely and accurate fashion.

It is also important to note that Aegis typically develops custom projects in our main code base, meaning that they are often forward-compatible through a given platform lifecycle.
